```
var readline = require('readline'),
  rl = readline.createInterface(process.stdin,
process.stdout),
  prefix = 'OHAI> ';

rl.on('line', function(line) {
  switch(line.trim()) {
    case 'hello':
      console.log('world!');
  break;
    default:
      console.log('Say what? I might have heard `' +
line.trim() + '`');
      break;
  }
  rl.setPrompt(prefix, prefix.length);
  rl.prompt();
}).on('close', function() {
  console.log('Have a great day!');
  process.exit(0);
});
```

```
console.log('Starting directory: ' +
process.cwd());
try {
  process.chdir('/tmp');
  console.log('New directory: ' +
process.cwd());
}
catch (err) {
  console.log('chdir: ' + err);
}
```

Real Time Web

WITH NODE.JS

INTRO TO NODE.JS

- LEVEL ONE -

WHAT IS NODE.JS?

Allows you to build scalable network applications using JavaScript on the server-side.

Node.js

V8 JavaScript Runtime

It's fast because it's mostly C code

WHAT COULD YOU BUILD?

- Websocket Server *Like a chat server*
- Fast File Upload Client
- Ad Server
- Any Real-Time Data Apps

WHAT IS NODE.JS NOT?

- A Web Framework
- For Beginners *It's very low level*
- Multi-threaded

You can think of it as a single threaded server

OBJECTIVE: PRINT FILE CONTENTS

- Blocking Code

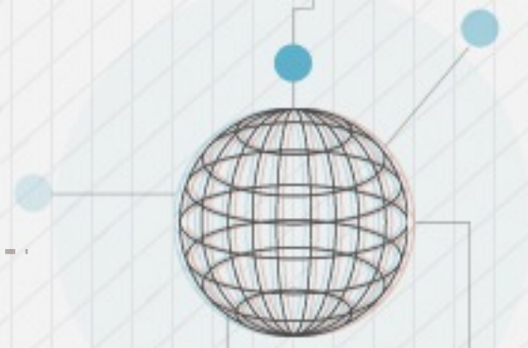
```
Read file from Filesystem, set equal to “contents”
Print contents
Do something else
```

- Non-Blocking Code

```
Read file from Filesystem
  whenever you’re complete, print the contents
Do Something else
```

This is a “Callback”

BLOCKING VS NON-BLOCKING



- Blocking Code

```
var contents = fs.readFileSync('/etc/hosts');
console.log(contents);
console.log('Doing something else');
```

Stop process until complete

- Non-Blocking Code

```
fs.readFile('/etc/hosts', function(err, contents) {
  console.log(contents);
});
console.log('Doing something else');
```

CALLBACK ALTERNATE SYNTAX

```
fs.readFile('/etc/hosts', function(err, contents) {
  console.log(contents);
});
```

Same as

```
var callback = function(err, contents) {
  console.log(contents);
}

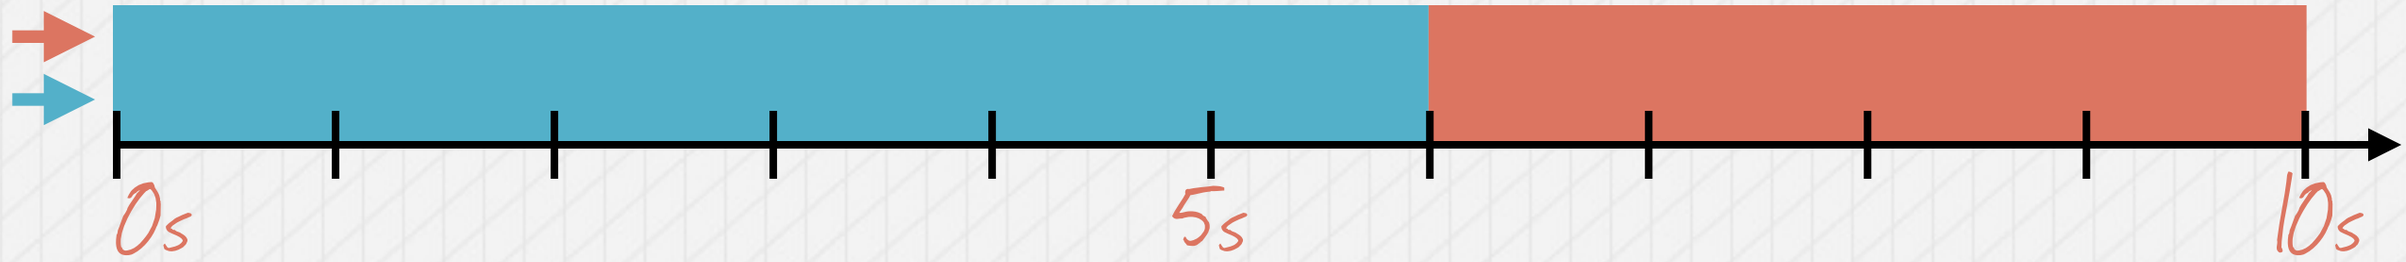
fs.readFile('/etc/hosts', callback);
```

BLOCKING VS NON-BLOCKING

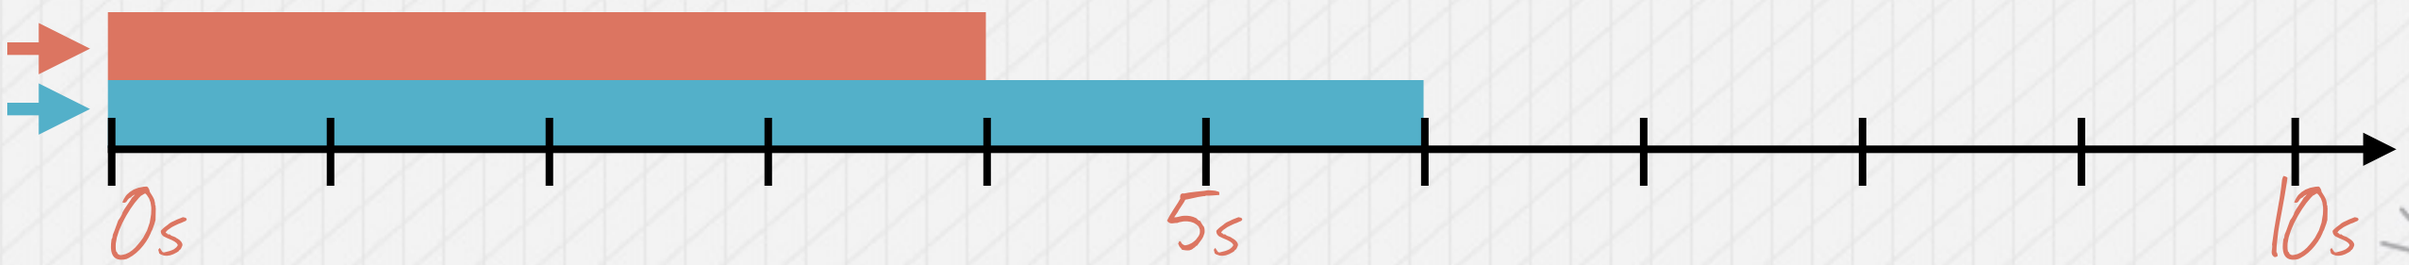
```
var callback = function(err, contents) {
  console.log(contents);
}

fs.readFile('/etc/hosts', callback);
fs.readFile('/etc/inetcfg', callback);
```

blocking



non-blocking



NODE.JS HELLO DOG

hello.js

```
var http = require('http');  How we require modules

http.createServer(function(request, response) {
  response.writeHead(200);   Status code in header
  response.write("Hello, this is dog.");  Response body
  response.end(); Close the connection
}).listen(8080, function(){  Listen for connections on this port
  console.log('Listening on port 8080...');
});
```

```
$ node hello.js   Run the server
```

----> Listening on port 8080...

```
$ curl http://localhost:8080
```

----> Hello, this is dog.

THE EVENT LOOP

```
var http = require('http');
http.createServer(function(request, response) {
  ...
}).listen(8080, function(){
  console.log('Listening on port 8080...');
});
```

Starts the Event Loop when finished

Run the Callback

Known Events

request

WHY JAVASCRIPT?

"JavaScript has certain characteristics that make it very different than other dynamic languages, namely that it has no concept of threads. Its model of concurrency is completely based around events."

- Ryan Dahl

THE EVENT LOOP

Event Queue

- close
- request

Known Events

- request
- connection
- close

Events processed one at a time

WITH LONG RUNNING PROCESS

```
var http = require('http');

http.createServer(function(request, response) {
  response.writeHead(200);
  response.write("Dog is running.");
  setTimeout(function(){    Represent long running process
    response.write("Dog is done.");
    response.end();
  }, 5000);  5000ms = 5 seconds
}).listen(8080);
```

TWO CALLBACKS HERE

```
var http = require('http');

http.createServer(function(request, response) {
  response.writeHead(200);
  response.write("Dog is running.");
  setTimeout(function(){
    response.write("Dog is done.");
    response.end();
  }, 5000);
}).listen(8080);
```

request

timeout

TWO CALLBACKS TIMELINE

- Request comes in, triggers request event
  - Request Callback executes
    - setTimeout registered
      - Request comes in, triggers request event
        - Request Callback executes
        - setTimeout registered
      - triggers setTimeout event
      - setTimeout Callback executes
      - triggers setTimeout event
      - setTimeout Callback

request

timeout

0s

5s

10s

WITH BLOCKING TIMELINE

Request comes in, triggers request event

Request Callback executes

setTimeout executed

Request comes in, waits for server

triggers setTimeout event

setTimeout Callback executed

Request comes in

Request Callback executes

Wasted Time

0s

5s

10s

TYPICAL BLOCKING THINGS

- Calls out to web services
- Reads/Writes on the Database
- Calls to extensions

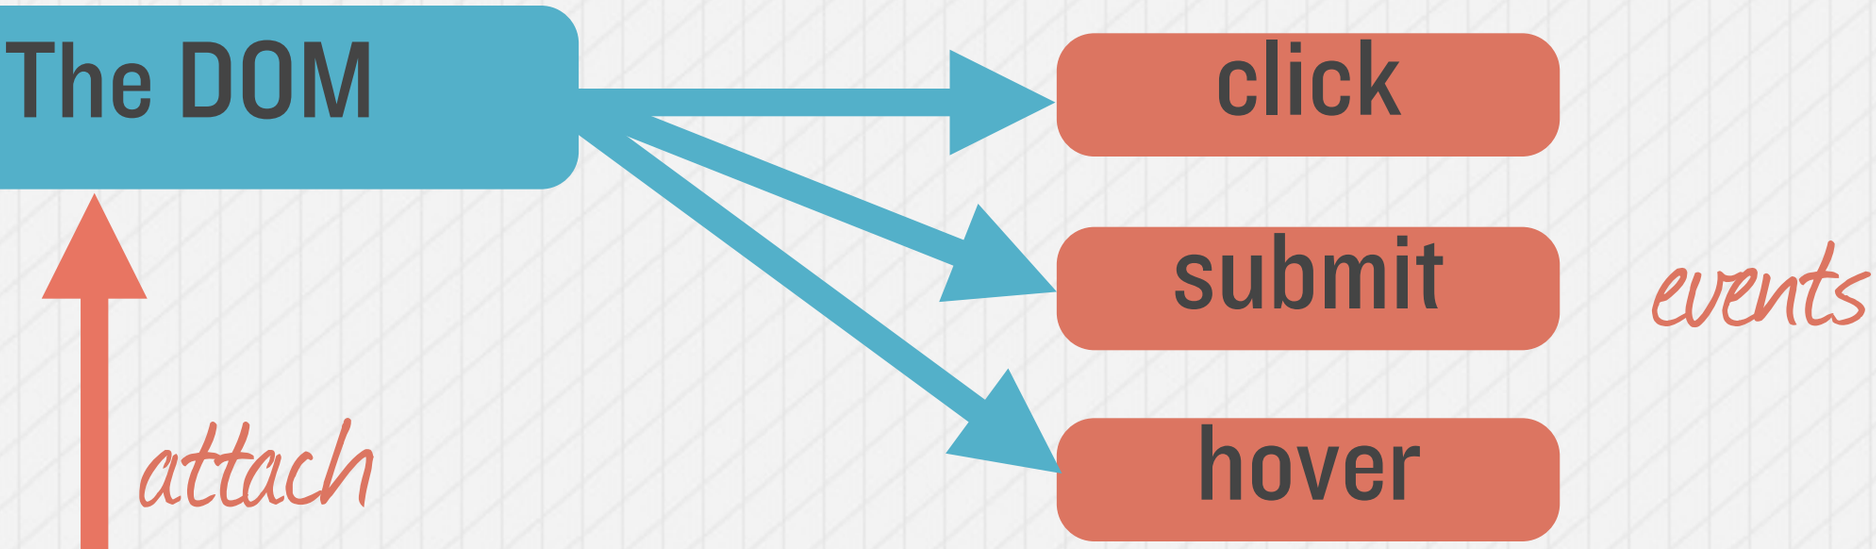
EVENTS

- LEVEL TWO -

EVENTS IN THE DOM

The DOM triggers Events

you can listen for those events

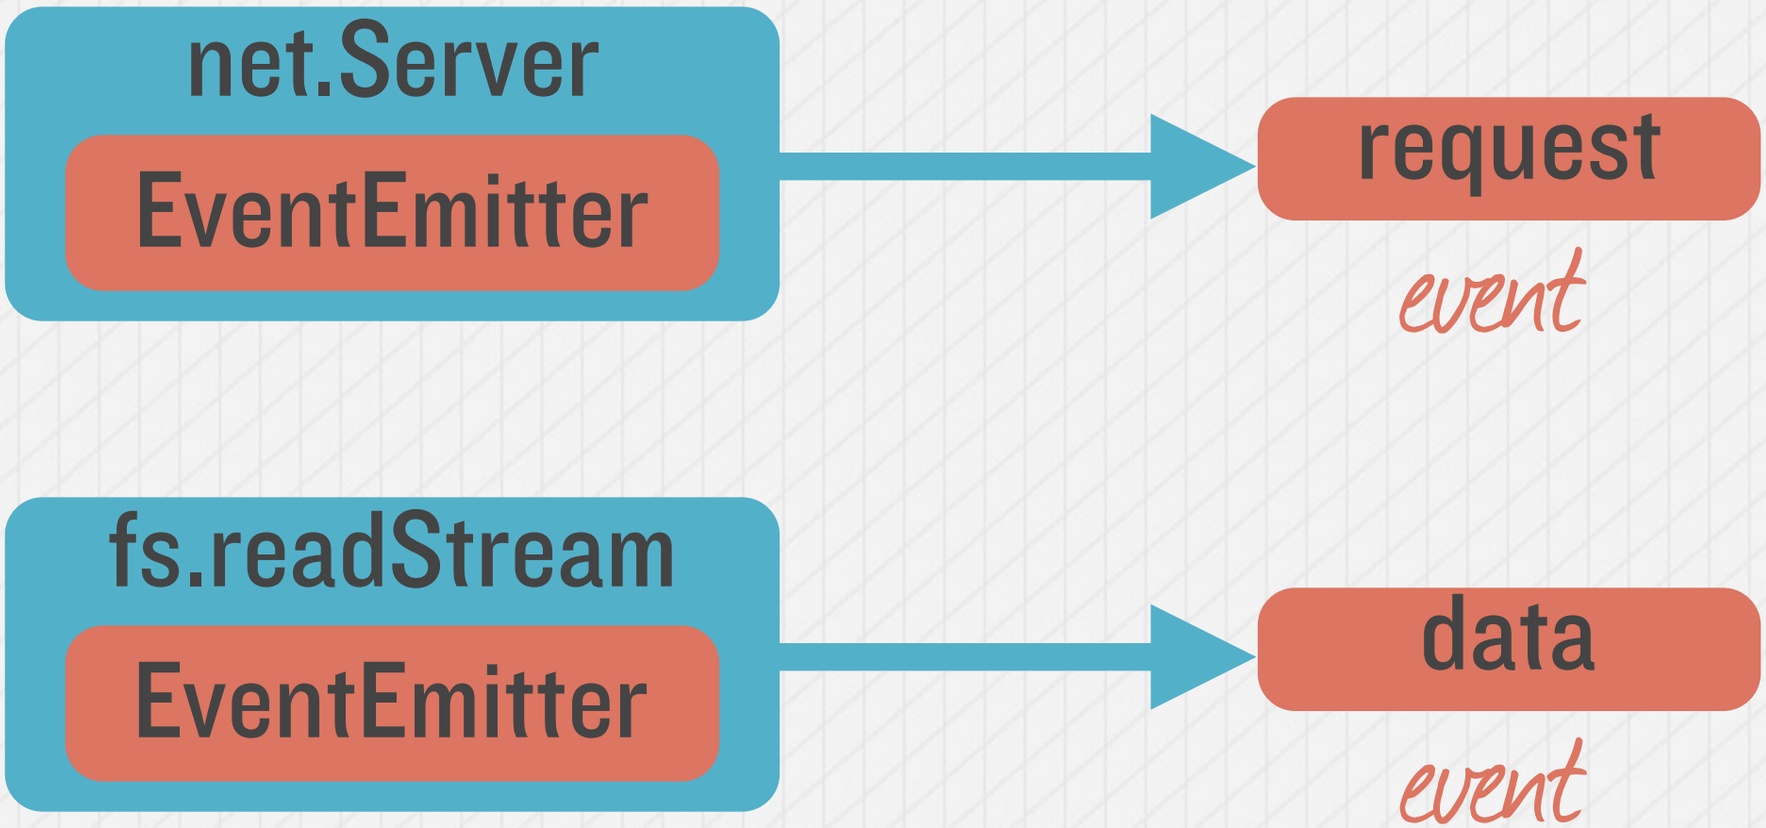


```
$("p").on("click", function(){ ... });
```

When ‘click’ event is triggered

EVENTS IN NODE

Many objects in Node emit events



CUSTOM EVENT EMITTERS

```
var EventEmitter = require('events').EventEmitter;
```

```
var logger = new EventEmitter();
```

events

error warn info

```
logger.on('error', function(message){
  console.log('ERR: ' + message);
});
```

listen for error event

```
logger.emit('error', 'Spilled Milk');
```

-> ERR: Spilled Milk

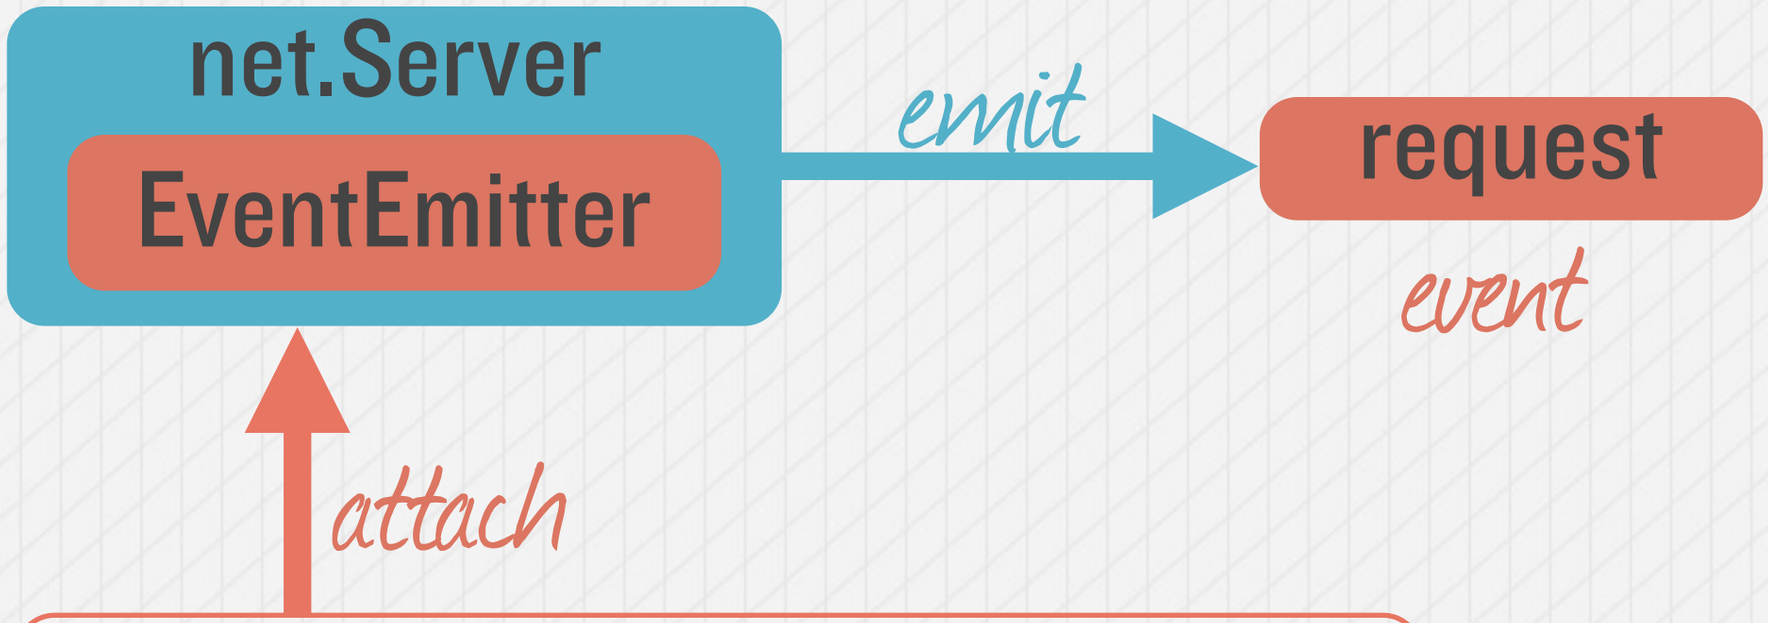
```
logger.emit('error', 'Eggs Cracked');
```

-> ERR: Eggs Cracked

EVENTS

EVENTS IN NODE

Many objects in Node emit events



```
function(request, response){ .. }
```

When ‘request’ event is emitted

HTTP ECHO SERVER

```
http.createServer(function(request, response){ ... });
```

But what is really going on here?

http://nodejs.org/api/

EVENTS

BREAKING IT DOWN

```
http.createServer(function(request, response){ ... });
```

http.createServer([requestListener])

Returns a new web server object.

The `requestListener` is a function which is automatically added to the `'request'` event.

Class: http.Server

This is an `EventEmitter` with the following events:

Event: 'request'

```
function (request, response) { }
```

Emitted each time there is a request.

ALTERNATE SYNTAX

```
http.createServer(function(request, response){ ... });
```

Same as

```
var server = http.createServer();
server.on('request', function(request, response){ ... });
```

This is how we add event listeners

Event: 'close'

`function () { }`

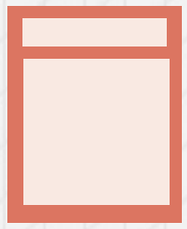
Emitted when the server closes.

```
server.on('close', function(){ ... });
```

STREAMS

- LEVEL THREE -

WHAT ARE STREAMS?



Start Processing Immediately

Streams can be readable, writeable, or both

The API described here is for streams in Node version v0.10.x a.k.a. streams2

STREAMING RESPONSE

readable stream *writable stream*

```
http.createServer(function(request, response) {
  response.writeHead(200);
  response.write("<p>Dog is running.</p>");
  setTimeout(function(){
    response.write("<p>Dog is done.</p>");
    response.end();
  }, 5000);
}).listen(8080);
```

Our browser receives

"Dog is running."

(5 seconds later)

"Dog is done."

STREAMS

HOW TO READ FROM THE REQUEST?

Let's print what we receive from the request.

```
http.createServer(function(request, response) {
  response.writeHead(200);
  request.on('readable', function() {
    var chunk = null;
    while (null !== (chunk = request.read())) {
      console.log(chunk.toString());
    }
  });
  request.on('end', function() {
    response.end();
  });
}).listen(8080)
```

HOW TO READ FROM THE REQUEST?

```
http.createServer(function(request, response) {
   response.writeHead(200);
   request.on('readable', function() {
      var chunk = null;
      while (null !== (chunk = request.read())) {
         response.write(chunk);
      }
   });
   request.on('end', function() {
      response.end();
   });
}).listen(8080)
```

```
request.pipe(response);
```

LET'S CREATE AN ECHO SERVER!

```
http.createServer(function(request, response) {
  response.writeHead(200);
  request.pipe(response);
}).listen(8080)
```

```
$ curl -d 'hello' http://localhost:8080
```

----> Hello *on client*

Kinda like on the command line

```
cat 'bleh.txt' | grep 'something'
```

STREAMS

DOCUMENTATION http://nodejs.org/api/

Stability Scores

File System

> Stability: 3 - Stable

File I/O is provided by simple wrappers around standard PO
`require('fs')`. All the methods have asynchronous and sy

The asynchronous form always take a completion callback as
completion callback depend on the method, but the first argu
operation was completed successfully, then the first argumen

When using the synchronous form any exceptions are immed
exceptions or allow them to bubble up.

Here is an example of the asynchronous version:

```
var fs = require('fs');

fs.unlink('/tmp/hello', function (err) {
```

Stream

> Stability: 2 - Unstable

A stream is an abstract interface implemented by various objects in No
server is a stream, as is stdout. Streams are readable, writable, or both.

You can load the Stream base classes by doing `require('stream')`. T
Readable streams, Writable streams, Duplex streams, and Transform s

This document is split up into 3 sections. The first explains the parts of
use streams in your programs. If you never implement a streaming API

The second section explains the parts of the API that you need to use i
yourself. The API is designed to make this easy for you to do.

The third section goes into more depth about how streams work, inclu
functions that you should probably not modify unless you definitely kn

API for Stream Consumers

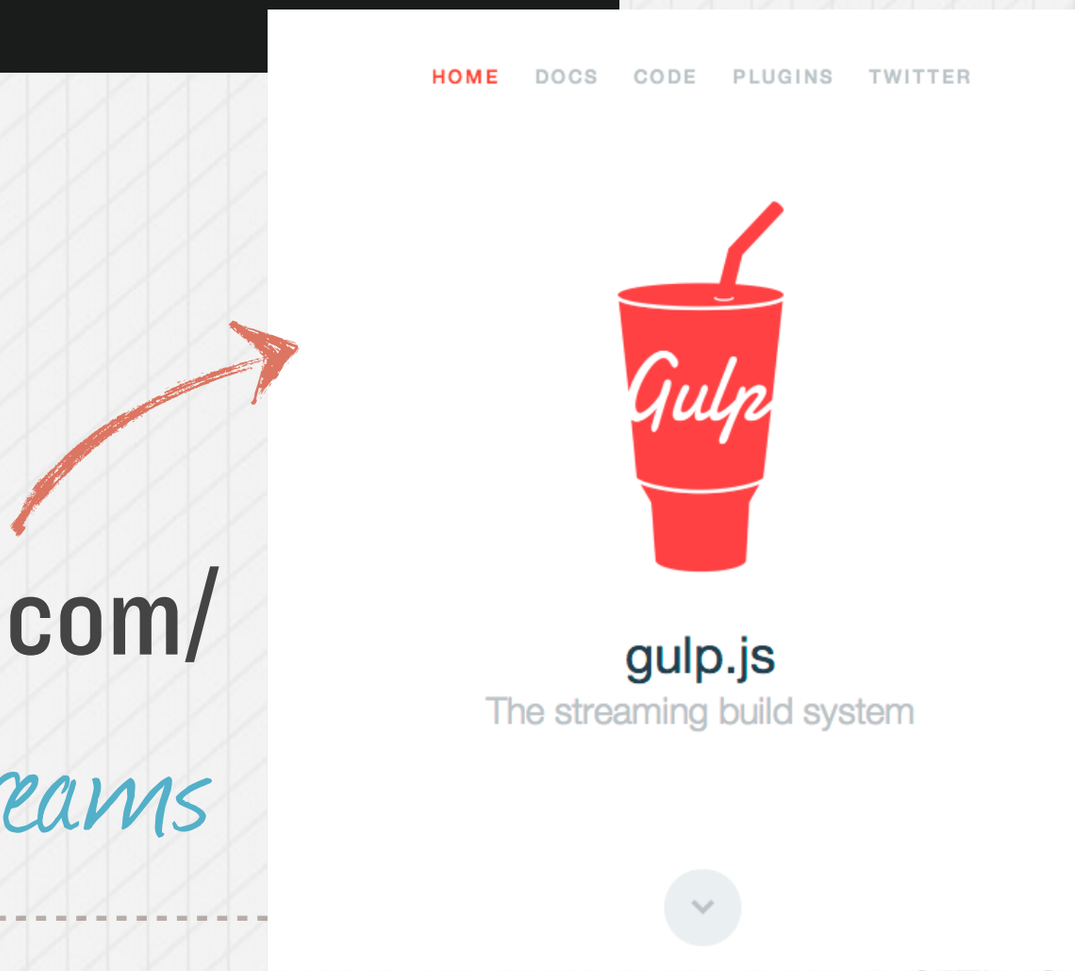
STREAMS

READING AND WRITING A FILE

```
var fs = require('fs');
var file = fs.createReadStream("readme.md");
var newFile = fs.createWriteStream("readme_copy.md");

file.pipe(newFile);
```

require filesystem module



http://gulpjs.com/

Build system built on top of Streams

STREAMS

UPLOAD A FILE

```
var fs = require('fs');
var http = require('http');

http.createServer(function(request, response) {
   var newFile = fs.createWriteStream("readme_copy.md");
   request.pipe(newFile);

   request.on('end', function() {
      response.end('uploaded!');
   });
}).listen(8080);
```

```
$ curl --upload-file readme.md http://localhost:8080
```

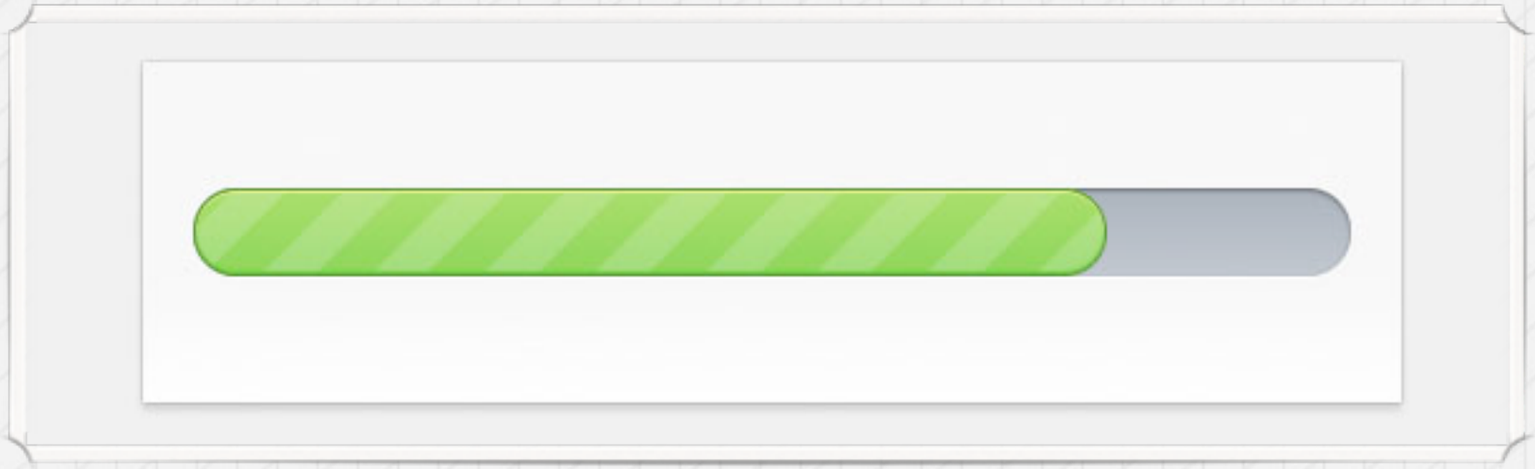
FILE UPLOADING PROGRESS



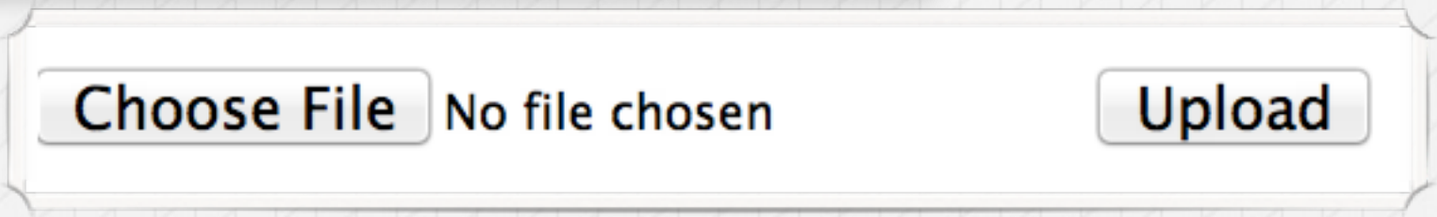
STREAMS

FILE UPLOADING PROGRESS

```
$ curl --upload-file file.jpg http://localhost:8080
```

Outputs:

```
progress: 3%
progress: 6%
progress: 9%
progress: 12%
progress: 13%
...
progress: 99%
progress: 100%
```



We're going to need:

- HTTP Server
- File System

STREAMS

REMEMBER THIS CODE?

```
var fs = require('fs');
var http = require('http');

http.createServer(function(request, response) {
   var newFile = fs.createWriteStream("readme_copy.md");
   request.pipe(newFile);

   request.on('end', function() {
      response.end('uploaded!');
   });
}).listen(8080);
```

STREAMS

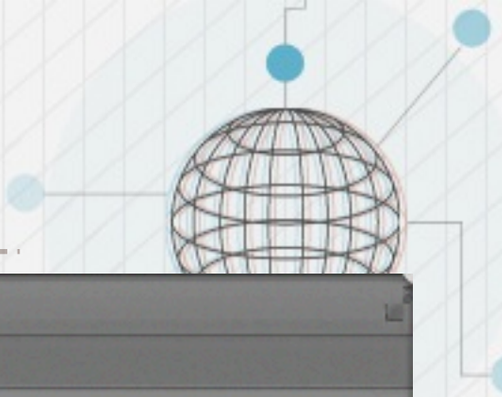
REMEMBER THIS CODE?

```
http.createServer(function(request, response) {
   var newFile = fs.createWriteStream("readme_copy.md");
   var fileBytes = request.headers['content-length'];
   var uploadedBytes = 0;

   request.on('readable', function() {
     var chunk = null;
     while(null !== (chunk = request.read())){
       uploadedBytes += chunk.length;
       var progress = (uploadedBytes / fileBytes) * 100;
       response.write("progress: " + parseInt(progress, 10) + "%\n");
     }
   });

   request.pipe(newFile);
   ...
}).listen(8080);
```

SHOWING PROGRESS



STREAMS

MODULES

- LEVEL FOUR -

REQUIRING MODULES

```
var http = require('http');
```

--------> http.js

```
var fs = require('fs');
```

--------> fs.js

How does 'require' return the libraries?

How does it find these files?

LET'S CREATE OUR OWN MODULE

custom_hello.js

```
var hello = function() {
  console.log("hello!");
}

module.exports = hello;
```

custom_goodbye.js

```
exports.goodbye = function() {
  console.log("bye!");
}
```

app.js

exports defines what require returns

```
var hello = require('./custom_hello');
var gb = require('./custom_goodbye');

hello();
gb.goodbye();
```

```
require('./custom_goodbye').goodbye();
```

If we only need to call once

EXPORT MULTIPLE FUNCTIONS

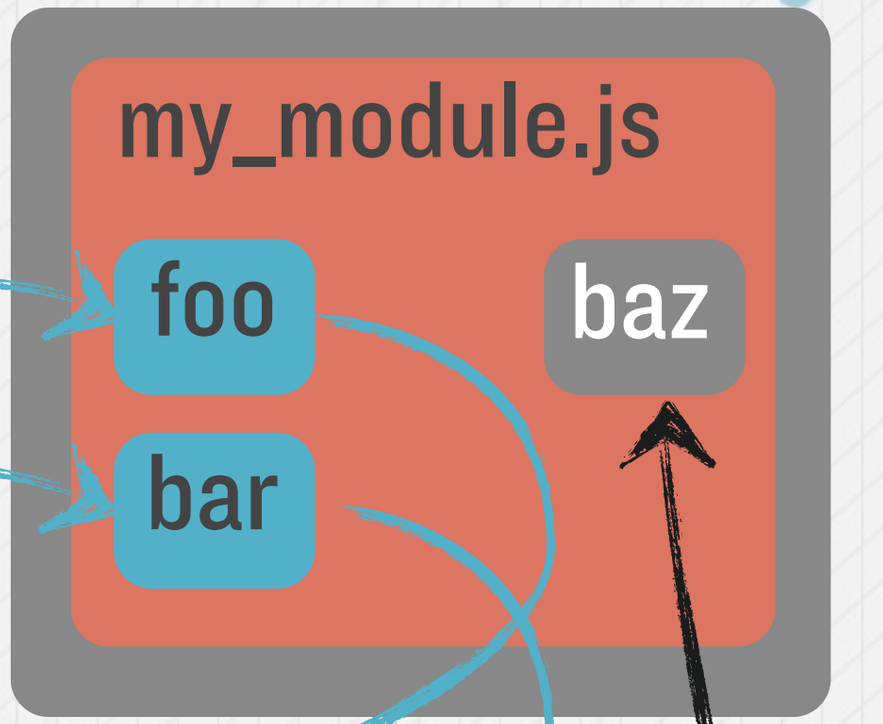
my_module.js

```
var foo = function() { ... }
var bar = function() { ... }
var baz = function() { ... }

exports.foo = foo
exports.bar = bar
```

app.js

```
var myMod = require('./my_module');
myMod.foo();
myMod.bar();
```



MAKING HTTP REQUESTS

app.js

```
var http = require('http');

var message = "Here's looking at you, kid.";
var options = {
  host: 'localhost', port: 8080, path: '/', method: 'POST'
}

var request = http.request(options, function(response){
  response.on('data', function(data){
    console.log(data);
  });
});
request.write(message);
request.end();
```

logs response body

begins request

finishes request

MODULES

ENCAPSULATING THE FUNCTION

app.js

```
var http = require('http');

var makeRequest = function(message) {
  var options = {
    host: 'localhost', port: 8080, path: '/', method: 'POST'
  }

  var request = http.request(options, function(response){
    response.on('data', function(data){
      console.log(data);
    });
  });
  request.write(message);
  request.end();
}

makeRequest("Here's looking at you, kid.");
```

CREATING & USING A MODULE

make_request.js

```
var http = require('http');

var makeRequest = function(message) {
   ...
}

module.exports = makeRequest;
```

app.js

```
var makeRequest = require('./make_request');

makeRequest("Here's looking at you, kid");
makeRequest("Hello, this is dog");
```

Where does require look for modules?

MODULES

REQUIRE SEARCH

```
var make_request = require('./make_request')
var make_request = require('../make_request')
var make_request = require('/Users/eric/nodes/make_request')
```

look in same directory

look in parent directory

/Home/eric/my_app/app.js

Search in node_modules directories

```
var make_request = require('make_request')
```

- /Home/eric/my_app/node_modules/make_request.js
- /Home/eric/node_modules/make_request.js
- /Home/node_modules/make_request.js
- /node_modules/make_request.js

MODULES

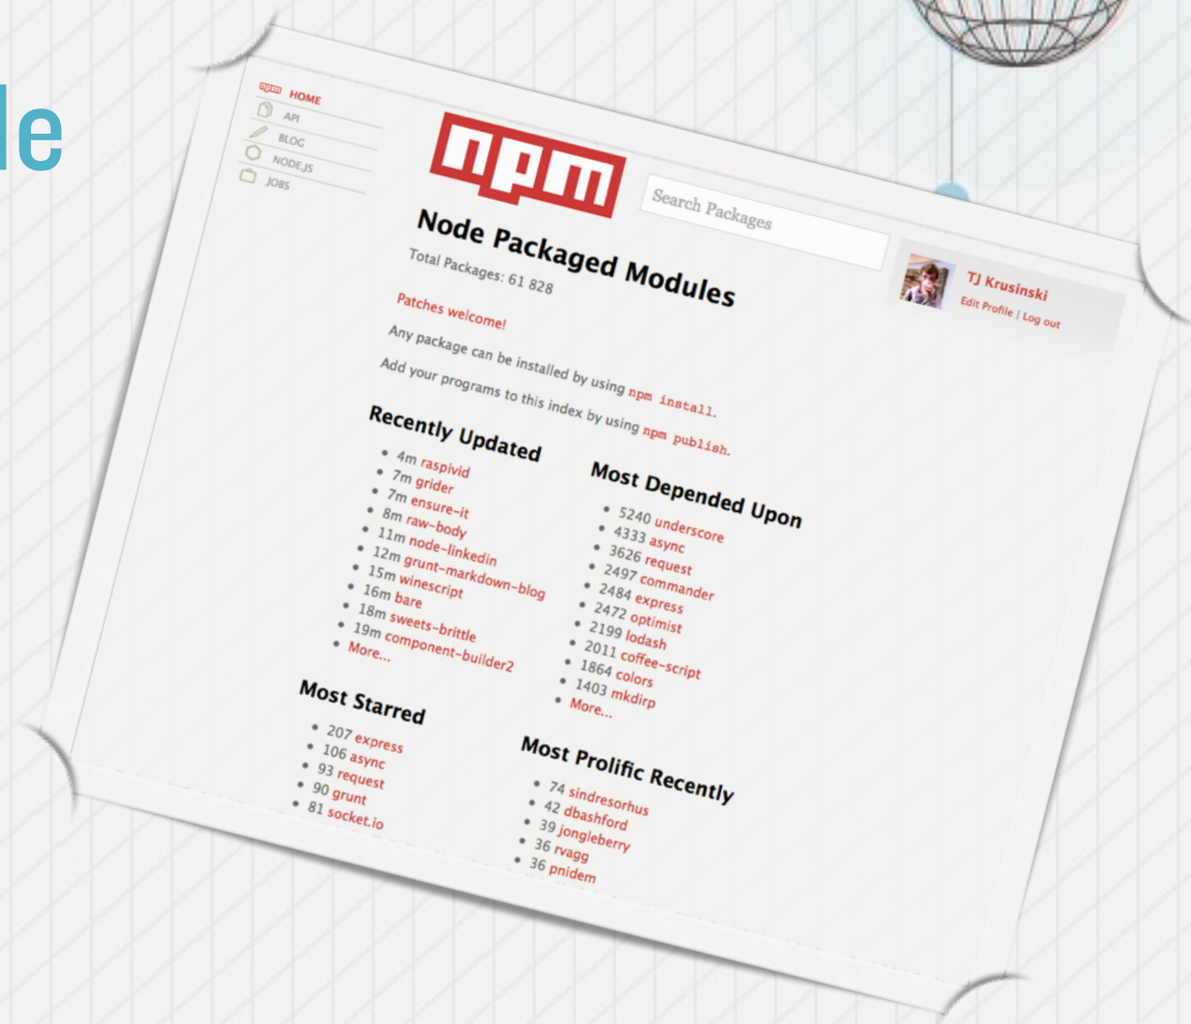
However, all packages are directories

NPM: THE USERLAND SEA

Package manager for node

- Comes with node
- Module Repository
- Dependency Management
- Easily publish modules

http://npmjs.org



MODULES

INSTALLING A NPM MODULE

In /Home/my_app

```
$ npm install request
```

Installs into local node_modules directory

Home / my_app / node_modules / reques

In /Home/my_app/app.js

```
var request = require('request');
```

Loads from local node_modules directory

LOCAL VS GLOBAL

Install modules with executables globally

```
$ npm install coffee-script -g
```

global

```
$ coffee app.coffee
```

Global npm modules can't be required

```
var coffee = require('coffee-script');
```

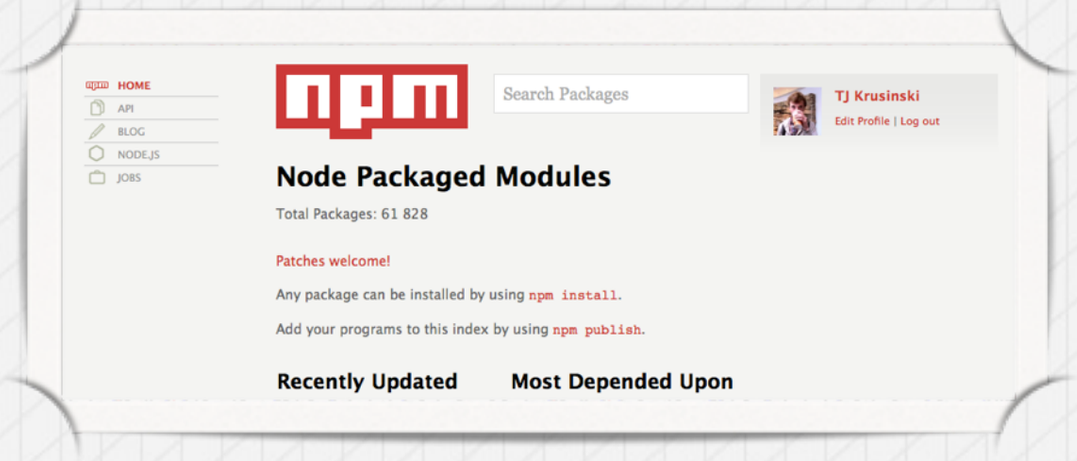
```
$ npm install coffee-script
```

Install them locally

```
var coffee = require('coffee-script');
```

FINDING MODULES

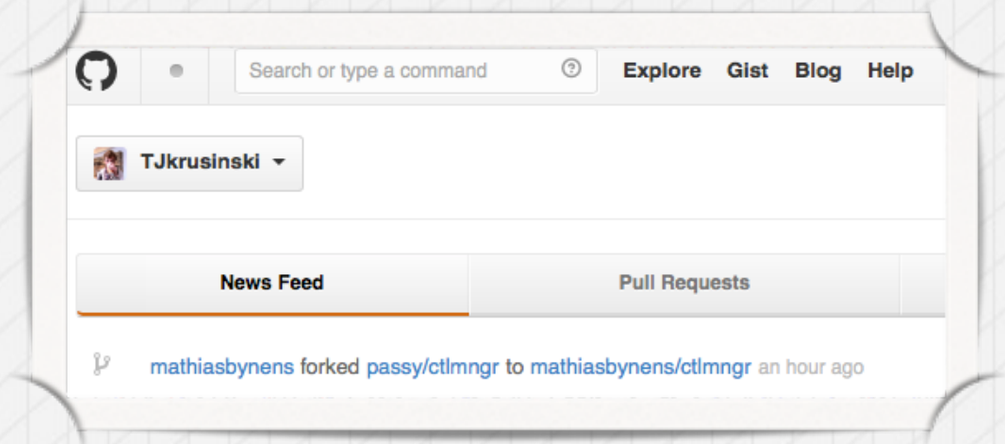
npm registry



npm command line

```
$ npm search request
```

github search



DEFINING YOUR DEPENDENCIES

my_app/package.json

```
{
  "name": "My App",
  "version": "1",

app.js

```
io.sockets.on('connection', function(client) {
  ...
  client.on('join', function(name) {
    messages.forEach(function(message) {
      client.emit("messages", message.name + ": " + message.data);
    });    iterate through messages array
  });   and emit a message on the connecting
});                client for each one
```

PERSISTING DATA

REDIS

```
$ npm install redis --save
```

```
var redis = require('redis');
var client = redis.createClient();

client.set("message1", "hello, yes this is dog");
client.set("message2", "hello, no this is spider");
```

key *value*

```
client.get("message1", function(err, reply){
  console.log(reply); ----> "hello, yes this is dog"
});
```

commands are non-blocking

PERSISTING DATA

REDIS LISTS: PUSHING

Add a string to the “messages” list

```
var message = "Hello, this is dog";
client.lpush("messages", message, function(err, reply){
  console.log(reply); ----> "1"
});
```

replies with list length

Add another string to “messages”

```
var message = "Hello, no this is spider";
client.lpush("messages", message, function(err, reply){
  console.log(reply); ----> "2"
});
```

REDIS LISTS: RETRIEVING

Using LPUSH & LTRIM

```
var message = "Hello, this is dog";
client.lpush("messages", message, function(err, reply){
  client.ltrim("messages", 0, 1);
});
```

trim keeps first two strings and removes the rest

Retrieving from list

```
client.lrange("messages", 0, -1, function(err, messages){
  console.log(messages);
})
```

replies with all strings in list

```
["Hello, no this is spider", "Oh sorry, wrong number"]
```

PERSISTING DATA

CONVERTING MESSAGES TO REDIS

app.js

```
var storeMessage = function(name, data){
  messages.push({name: name, data: data});

  if (messages.length > 10) {
    messages.shift();
  }
}
```

Let’s use the List data-structure

CONVERTING STOREMESSAGE

app.js

```
var redisClient = redis.createClient();

var storeMessage = function(name, data){
  var message = JSON.stringify({name: name, data: data});

  redisClient.lpush("messages", message, function(err, response) {
    redisClient.ltrim("messages", 0, 9);
  });
}
```

need to turn object into string to store in redis

keeps newest 10 items

OUTPUT FROM LIST

app.js

```
client.on('join', function(name) {
   messages.forEach(function(message) {
      client.emit("messages", message.name + ": " + message.data);
   });
});
```

PERSISTING DATA

OUTPUT FROM LIST

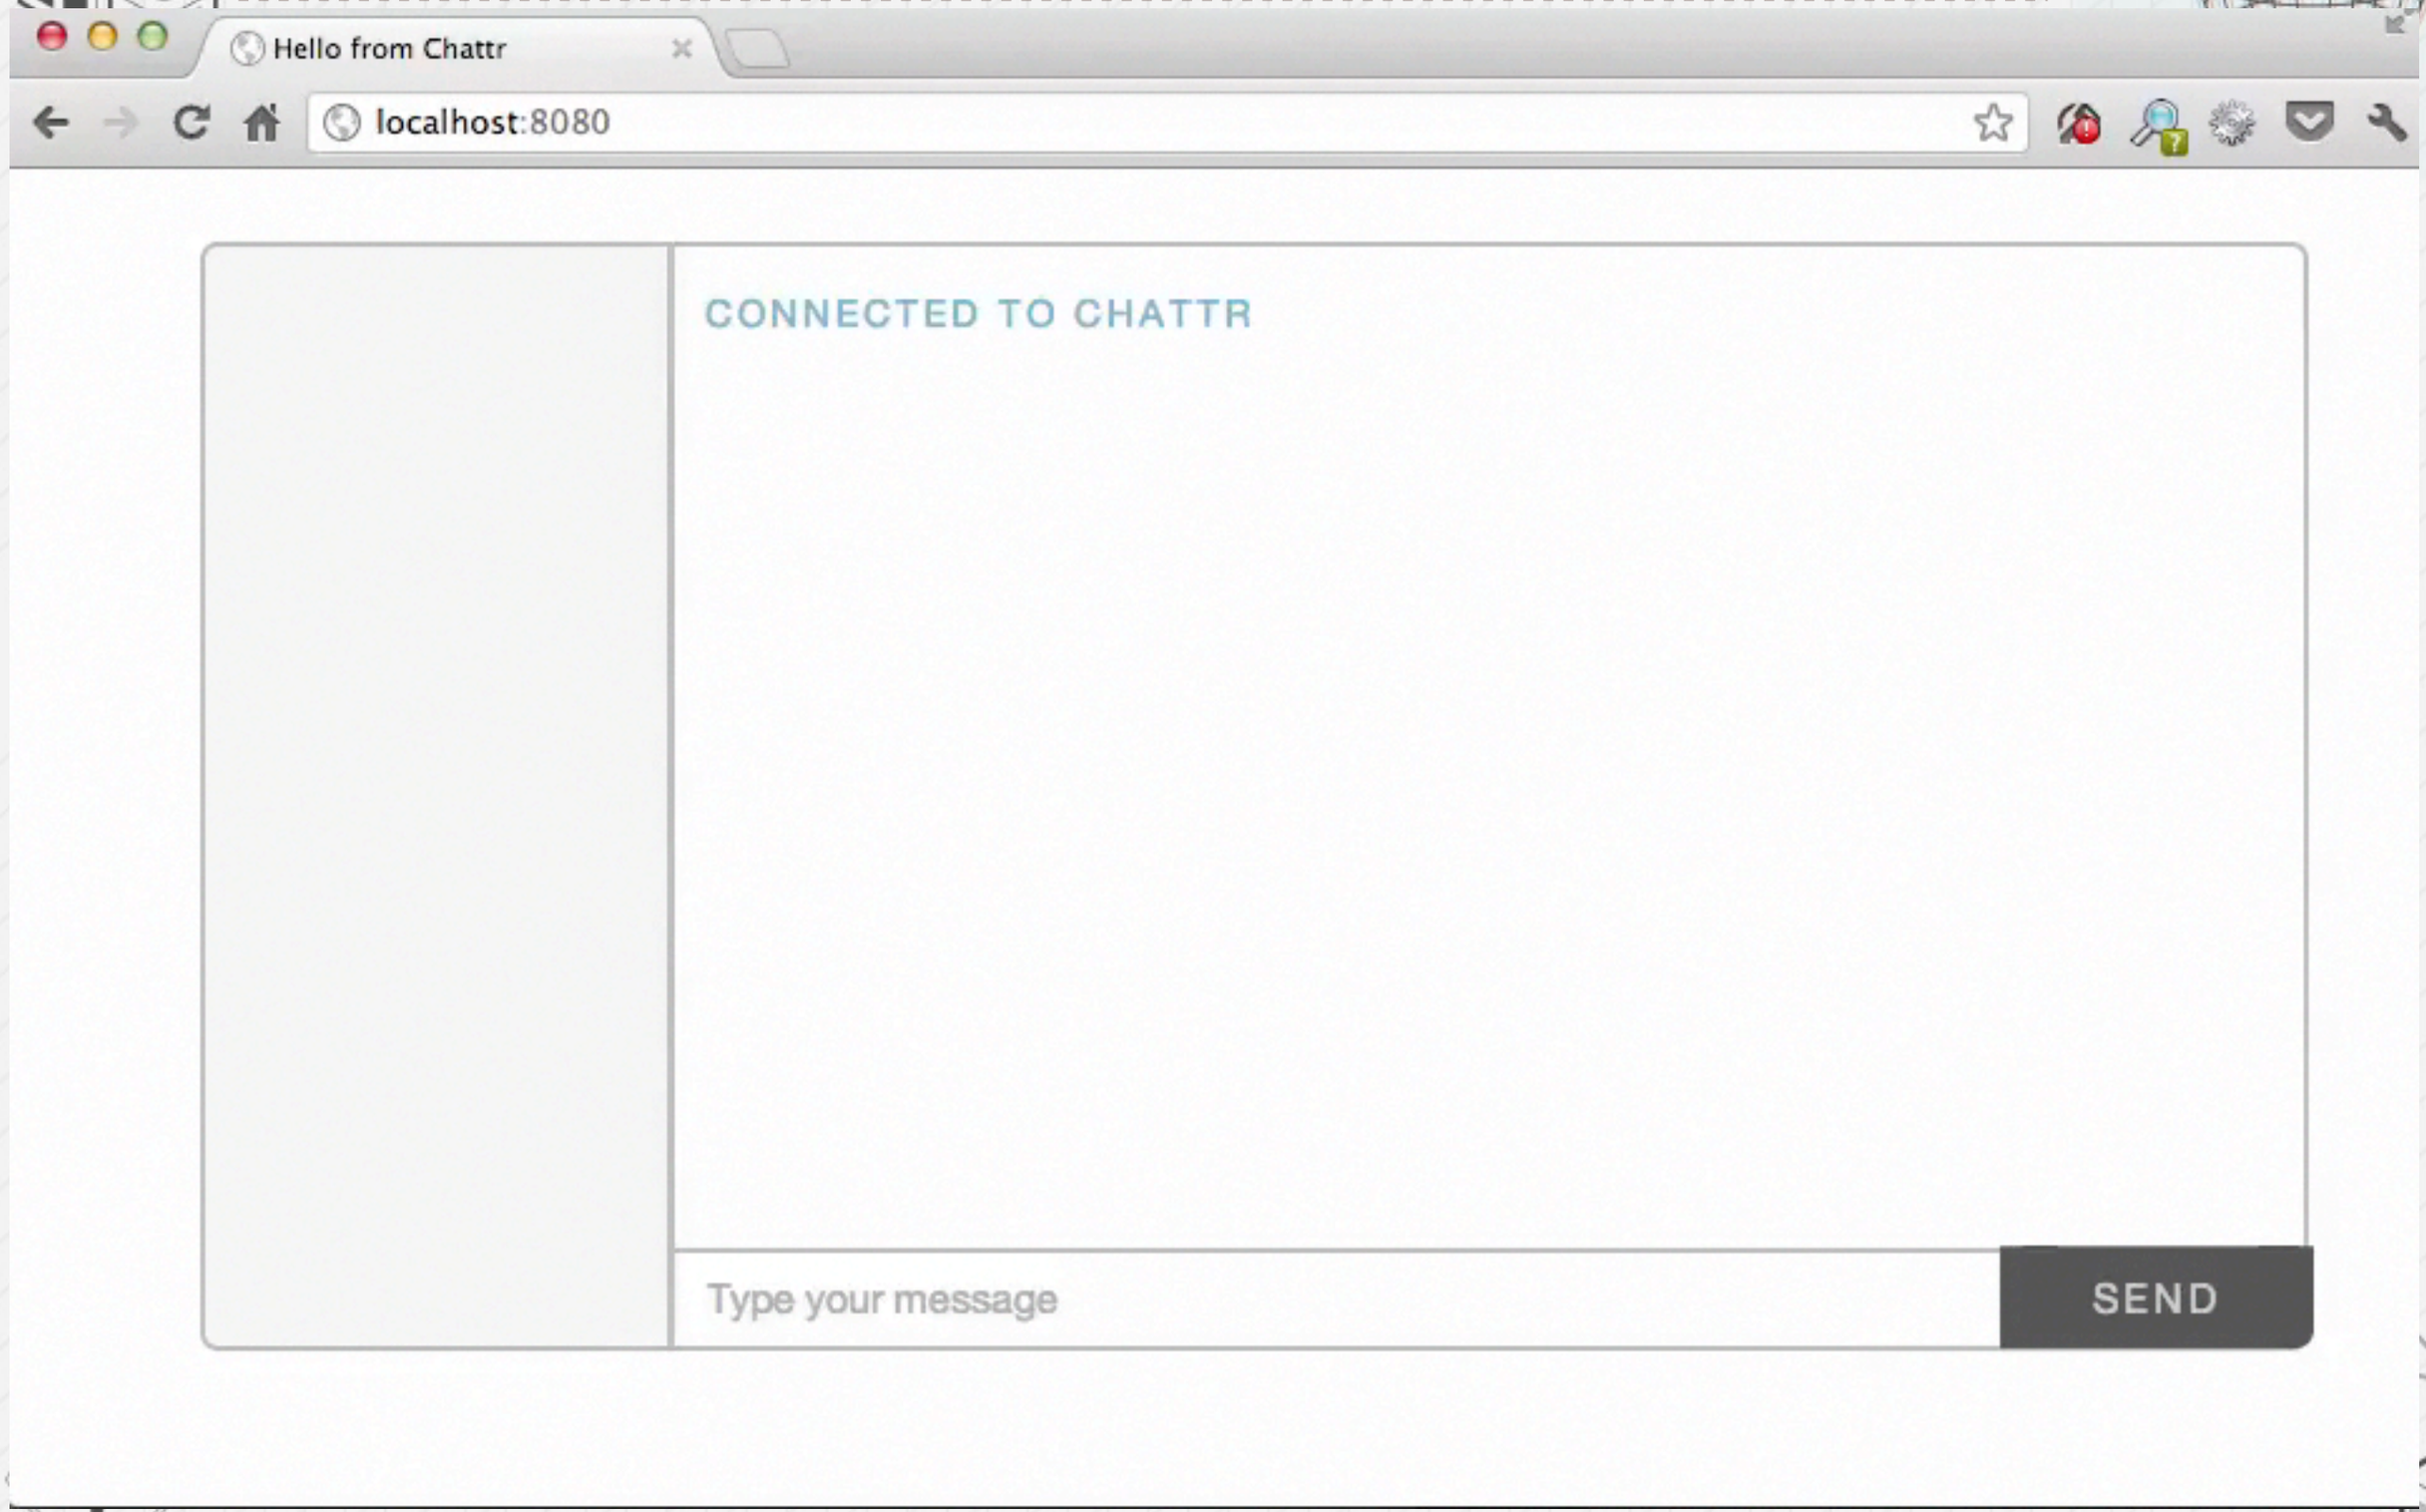
app.js

```
client.on('join', function(name) {
  redisClient.lrange("messages", 0, -1, function(err, messages){
    messages = messages.reverse();      reverse so they are emitted
                                              in correct order

    messages.forEach(function(message) {
      message = JSON.parse(message);    parse into JSON object
      client.emit("messages", message.name + ": " + message.data);
    });
  });
});
```

PERSISTING DATA

IN ACTION



Hello from Chattr
localhost:8080
CONNECTED TO CHATTR
Type your message
SEND

CURRENT CHATTER LIST

Sets are lists of unique data

add & remove members of the names set

```
client.sadd("names", "Dog");
client.sadd("names", "Spider");
client.sadd("names", "Gregg");
```

```
client.srem("names", "Spider");
```

reply with all members of set

```
client.smembers("names", function(err, names){
  console.log(names);
});
```

```
["Dog", "Gregg"]
```

ADDING CHATTERS

app.js

```
client.on('join', function(name){

   notify other clients a chatter has joined
   client.broadcast.emit("add chatter", name);

   redisClient.sadd("chatters", name);
});          add name to chatters set
```

index.html

```
socket.on('add chatter', function(name) {
   var chatter = $('<li>'+name+'</li>').data('name', name);
   $('#chatters').append(chatter);
});
```

PERSISTING DATA

ADDING CHATTERS (CONT)

app.js

```
client.on('join', function(name){
  client.broadcast.emit("add chatter", name);

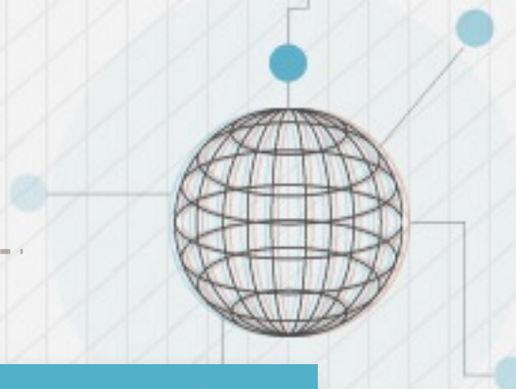
  redisClient.smembers('names', function(err, names) {
    names.forEach(function(name){
      client.emit('add chatter', name);
    });
  });

  redisClient.sadd("chatters", name);
});
```

emit all the currently logged in chatters to the newly connected client

PERSISTING DATA

REMOVING CHATTERS



remove chatter when they disconnect from server

app.js

```
client.on('disconnect', function(name){
   client.broadcast.emit("remove chatter", client.nickname);
   redisClient.srem("chatters", client.nickname;);
});
```

index.html

```
server.on('remove chatter', function(name) {
   $('#chatters li[data-name=’+ name + ']').remove();
});
```

PERSISTING DATA

WELCOME TO CHATTR
