Object literal shorthand syntax should be used

Code Smell

Strings and non-strings should not be added

Code Smell

Object literal syntax should be used

Code Smell

"undefined" should not be assigned

Code Smell

Trailing commas should not be used

Code Smell

Array constructors should not be used

Code Smell

Quotes for string literals should be used consistently

Code Smell

Statements should end with semicolons

Code Smell

Comments should not be located at the end of lines of code

Code Smell

Loops should not contain more than a single "break" or "continue" statement

Code Smell

Variable, property and parameter names should comply with a naming convention

Code Smell

Lines should not end with trailing whitespaces

Code Smell

"for...in" loops should filter properties before acting on them

Analyze your code

BugMajor?

The `for...in` statement allows you to loop through the names of all of the properties of an object. The list of properties includes all those properties that were inherited through the prototype chain. This has the side effect of serving up functions when the interest is in data properties. Programs that don't take this into account can fail.

Therefore, the body of every `for...in` statement should be wrapped in an `if` statement that filters which properties are acted upon. It can select for a particular type or range of values, or it can exclude functions, or it can exclude properties from the prototype.

Noncompliant Code Example

```
for (name in object) {
    doSomething(name); // Noncompliant
}
```

Compliant Solution

```
for (name in object) {
    if (object.hasOwnProperty(name)) {
        doSomething(name);
    }
}
```

Exceptions

Loops used to clone objects are ignored.

```
for (prop in obj) {
    a[prop] = obj[prop]; // Compliant by exception
}
```
