 Code Smell

Primitive types should be omitted from initialized or defaulted declarations

Non-null assertions should not be used

"undefined" should not be assigned

Trailing commas should not be used

Array constructors should not be used

Quotes for string literals should be used consistently

Statements should end with semicolons

Comments should not be located at the end of lines of code

Loops should not contain more than a single "break" or "continue" statement

Variable, property and parameter names should comply with a naming convention

Lines should not end with trailing whitespaces

Primitive return types should be used

Analyze your code

 Code Smell  Minor  proficiency

The return type any should be avoided because it prevents the type safety checks normally done by the compiler. When a function returns a primitive type (i.e. number, string or boolean) it is safe to replace any with number, string or boolean type respectively, or remove the return type completely and let compiler infer it.

Noncompliant Code Example

```
function foo() : any { // Noncompliant
  return 1;
}
```

Compliant Solution

```
function foo() {
  return 1;
}
// or
function foo(): number {
  return 1;
}
```
